

Model Development

Robert Clements

MSDS Program

University of San Francisco

We'll Start with Model Development and Talk About the Data Later

- Goal: to learn how to approach the development of a machine learning model like a scientist.
- How: in the lab we will grab some freely available ML datasets and use a popular tool called MLFlow to conduct “experiments”.
- Note: we are ***not*** going to be all that concerned with the actual model that we build. That is not the point here.

Experiment Tracking

How do YOU keep track of your models during model development?

Doing Experiments

- Not talking about Experimentation (A/B testing, Multi-armed Bandit)
- Main idea:

What Should We Track in our Experiments?

What are the metrics that we should track in our experiments?

What are the metrics that we should track in our experiments?

What are the metrics that we should track in our experiments?

What are the metrics that we should track in our experiments?

What are the metrics that we should track in our experiments?

What are the metrics that we should track in our experiments?

Examples

- You randomly split your data into a training and testing set using a random seed:
 - You should log the seed and version your training, validation and testing sets.
- You do hyperparameter tuning to find the optimal model:
 - You should log all results from each model (metric, performance charts, model weights, hyperparameter values) for each combination of hyperparameter values.
- You decide to try a different algorithm:
 - You should log all results of this model (metric, performance charts, model weights, hyperparameter values) to compare with your other models.

Why do we need a new tool to do this for us?

- It is difficult, and prone to error, to track results by porting them over to a spreadsheet.

[illegible]

Why do we need a new tool to do this for us?

- It is difficult, and prone to error, to track results by porting them over to a spreadsheet.

Experiment Tracking Tools

MLFlow

- MLFlow is a tool that promises to do four things:
 - Track experiments
 - Package projects
 - Store artifacts
 - Deploy models
- MLFlow is a python library:
 - Needs a backend store
 - Can run locally or on a server

MLFlow Architecture

- Where should everything be recorded?
- Options:

Experiment Tracking in MLFlow

```
Import mlflow

with mlflow.start_run():
    ...code...

    mlflow.set_tag("Tag_name", "Tag value")    creates metadata
    mlflow.log_params(params)
    mlflow.log_metric("metric_name", metric_value)
    mlflow.end_run()

OR

mlflow.autolog() # can customize what gets logged
mlflow.sklearn.autolog() # specific to sklearn
```

Experiment Tracking in MLFlow

```
Import mlflow

with mlflow.start_run():
    ...code...

    mlflow.set_tag("Tag_name", "Tag value")
    mlflow.log_params(params)
    mlflow.log_metric("metric_name", metric_value)
    mlflow.end_run()

OR

mlflow.autolog() # can customize what gets logged
mlflow.sklearn.autolog() # specific to sklearn
```

Autologging exists
for all of these

- Fastai
- Gluon
- Keras/TensorFlow
- LangChain
- LlamaIndex
- LightGBM
- OpenAI
- Paddle
- PySpark
- PyTorch
- Scikit-learn
- Spark
- Statsmodels
- XGBoost

MLFlow Experiment Tracking Demo

Artifact Tracking and Model Registry

What are artifacts?

- An artifact is any output file that you'd like to store from the runs of your experiments:

Model File

Data

Plots/images

What are artifacts?

- An artifact is any output file that you'd like to store from the runs of your experiments:

Artifact Tracking in MLFlow

```
Import mlflow

with mlflow.start_run():
    ...code...

    mlflow.set_tag("Tag_name", "Tag value")
    mlflow.log_params(params)
    mlflow.log_metric("metric_name", metric_value)

    mlflow.log_artifacts("path/to/artifact")

mlflow.end_run()
```

What is a model registry?

- A model registry is where you store and register your models.
